Part 2b. Description of Role with Payment Cards (ROC Sections 2.1 and 3.1)

Describe how the business stores, processes, and/or transmits account data.

The Shift4 solution is sold to merchants as a Software-as-a-Service (SaaS) offering. Shift4 supplies payment card authorization, accounting, fraud detection, and settlement services to a large, worldwide merchant client base. Shift4 provides a standard Application Service Provider (ASP) model and facilitates secure connections with merchant clients using proprietary, validated, Application Program Interface (API) applications. These Shift4 APIs are capable of securely connecting merchant client Point-of-Sale (POS) systems to credit, debit and private label transaction processors and acquirers and are also able to provide a complete tokenization solution allowing merchant

	<p>clients to never deal with CHD in any of their systems. Shift4 provides for a web-based virtual terminal interface allowing merchants to manual enter CHD for payment purposes.</p> <p>Transactions are sent to the payment gateway over the Internet via a TLS 1.2 connection or, for specified merchants, over a dedicated MPLS connection from the merchant via a TLS 1.2 connection. Based on the merchant's acceptance method, transaction may contain full PAN, Expiration Date, cardholder identification data (name & address), Full Track, and card validation code (CVV/CVC). Once authorization occurs, sensitive authentication data (SAD) is securely wiped. The PAN and expiry date are retained with the PAN encrypted. Shift4 returns a unique token to the merchant for their future use.</p> <p>Shift4 also supports a call center to provide non-transactional support to merchants that need to make payment adjustments, confirm a transaction occurred, or perform a refund. A call center technician will receive the call and if needed for support, will use an in-house application to retrieve the full PAN from storage and provide the PAN to the merchant over the phone. The call center technician does not initiate any form of transaction. These calls are recorded by the Calabrio call center VoIP platform and said recordings are encrypted and stored. Shift4 has a risk management group that uses an acquirer provided portal to assist merchants with risk management due to chargebacks. Where Shift4 UTG is hosted in a merchant environment, Shift4 can provide remote support via Command Center to push updates to the application. Command Center cannot access CHD / no CHD is involved with the Command Center processes.</p>
<p>Describe how the business is otherwise involved in or has the ability to impact the security of its customers' account data.</p>	<p>Shift4 accepts Cardholder Data (CHD) into their environment for both "Card-Present" and "Card-Not-Present" credit transactions. Shift4 acts as a value-added transaction payment gateway and provides a secure connection between merchant clients and their acquirer of record. For the merchant, Shift4 provides PA-DSS validated API payment components to facilitate transactions to interact with the Shift4 payment gateway solution. These solutions utilize encrypted connectivity over the Internet to connect to the Shift4 environment. Shift4's transmission technologies, client tokenization solutions, and secure transaction processing environment ensure that CHD is secured and protected throughout the entire transaction process. All storage of merchant CHD is housed securely in separate merchant databases residing in MS-SQL servers on internal network segments. All the tokenized and/or transactional data in each merchant database is fully encrypted using Blowfish (cipher-block chaining using a 256-bit key). Backups of all</p>

	<p>merchant data are also fully encrypted and remain under the control of Shift4 personnel. Shift4 also provides a call center to support merchants needing to confirm transactions occurred, to perform refunds, or to perform payment adjustments.</p>
<p>Describe system components that could impact the security of account data.</p>	<p>Application & web servers along with database servers use for storage and key management devices.</p>

Assessment reviewed the entity environment to include the network deployed at the co-location facility, access by the entity to the facility from the office locations, and connectivity to and from supported processors. In addition, the development and management of systems and the internal applications were reviewed.
